

Aluminium Venetian | Angled-Bay Measuring Guide

Measure in millimeters how far out from the window any vents or handles protrude. Add 35mm to this number (to allow space for the head rail of your aluminium venetian blinds) and make a note. This is the measurement you will use in the next step.

You will need:

- Metal Tape Measure
- Pencil
- Cardboard
- Scissors

Cut two pieces of paper into strips that are 300mm long and as wide as your previous measurement. These two pieces of paper will be used to work out how your blinds will meet each other at the corners. For example, if you don't have any handles to avoid, your depth would be 35mm. If you have handles that protrude by 30mm then your depth would be 65mm (35mm+30mm). 300mm 65mm Place these two papers Using a pencil, make a small individually on the mark on the windowsill at the windowsills either side of point where the paper meets one of your bay windows' the window frame. corners, making sure the edge of the paper is against Repeat steps two, three and the window frame. Slide four for each corner of your bay window. the two pieces of paper towards each other along the windowsills until the two corners of the papers meet up.

Measure between each set of marks you have made and write the measurements down. These are the widths of the blinds you will need to order.

To establish your drop, measure from where the top of the blind will sit, down to where you want the blind to stop (normally the windowsill). With the measurements for the widths and the drops of your blinds, all you need to do now is enter them into our site and order them with an 'Exact' measurement type.
